Sampling distributions . . . . . 2

$\tau$  . . . . . 2

$\mu$  . . . . . 2

$\mu_j$  . . . . . 2

First simulated data . . . . . 2

Smaller  $k_1$  . . . . . 4

Results when ‘fitting’ a tree from zero

## Sampling distributions

$\tau$

$$\tau | \mu_1, \dots, \mu_m, y, \alpha, \beta, k_1, k_2 \sim \text{Gamma}((n + m + 1)/2 + \alpha, \left( \frac{\sum_{j=1}^m \sum_{i=1}^{n_j} (y_{ij} - \mu_j)^2}{2} + \beta + \frac{\sum_{j=1}^m (\mu_j - \mu)^2}{2k_1} + \frac{\mu^2}{2k_2} \right))$$

$\mu$

$$\mu_j | \mu, y, \tau, k_1 \sim N\left(\frac{\mu/k_1 + \bar{y}_j n_j}{n_j + 1/k_1}, ((n_j + \frac{1}{k_1})\tau)^{-1}\right)$$

$\mu_j$

$$\mu | y, \tau, k_1, k_2 \sim MVN\left(\frac{\mathbf{1}^T \Psi^{-1} \mathbf{y}}{\mathbf{1}^T \Psi^{-1} \mathbf{1} + k_2^{-1}}, ((\mathbf{1}^T \Psi^{-1} \mathbf{1} + k_2^{-1})\tau)^{-1}\right)$$

## First simulated data

- Fixed small tree (one split, 2 nodes) in  $X_1 < 0.5$
- $n = 1000$ ;  $k_1 = 8$ ;  $k_2 = 5$ ;  $\mu_\mu = 0$ ;  $\alpha = 0.5$ ;  $\beta = 1$ ;  $m = 10$
- $k_1$  comes from a uniform  $\min\_u = 0$ ,  $\max\_u = 20$  with a weibull prior
- Red lines represent true values;
- Blue lines represent the average

model	RSS with group	RSS without group
